Kapitel 1

iPython

```
b = [1, 2, 3]
```

```
b
```

```
b.index?
```

```
b?
```

```
def quadrat(x):
```

```
    """
```

```
    Die Funktion liefert das Quadrat des Arguments
```

```
    """
```

```
    return x*x
```

```
quadrat?
```

```
quadrat??
```

```
%cd ..
```

```
!ls
```

```
%pwd
```

Primitive Datentypen

```
x, y = False, True
```

```
x and y
```

```
(not x)+y
```

```
4/7
```

```
w = 4/7
```

```
w.as_integer_ratio()
```

```
v = w.as_integer_ratio()
```

```
v[0]
```

```
w.hex()
```

```
16/7
```

```
16//7
```

```
16./7
```

```
int('0b1001', base=2)
```

```
Datei operatoren.py
```

```
Datei plot.py
```

Sequentielle Datentypen

```
z = "abcdefgäöüß"
```

```
t = (1, 'a', 0.765)
```

```
l = [z, t, 42]
```

```
l
```

```
l[1]
```

```
li = [1, 2, 3]
```

```
cli = li
```

```
cli
```

```
li[2] = 'a'
```

```
print("li = ", li, ", cli =", cli)
```

Bereiche

```
w = range(3,14)
```

```
w
```

```
for i in w: print(i)
```

```
li = [j for j in range(12)]
```

```
li
```

```
sum(li)
```

```
li[3:8]
```

```
li[-2]
```

```
li[:3]
```

```
li[2:7:2]
```

```
all([x>3 for x in li])
```

```
li
```

```
del li[2:7:2]
```

```
li
```

Operationen auf Listen

```
li = [j for j in range(12)]
```

```
li.append(13)
```

```
li.extend(li[:-4])
```

```
li.count(0)
```

```
li.index(4)
```

```
li.insert(12,13)
```

```
li
```

```
li.pop(12)
```

```
li
```

```
li.remove(0)
```

```
li.reverse()
```

```
li
```

```
li.sort()
```

```
li
```

```
li.sort(reverse=True)
```

```
li
```

```
li + [99, 100]  
li
```

Ausgewählte String-Methoden

```
s = "abra cada bra"  
s.islower()  
s.startswith("abra")  
s.endswith("bra")  
s.find("cada")  
s.isalpha()  
"abra"*3  
w = s.split()  
w  
s.count('a')
```

Formatierung von Strings

```
s = "Winter{}Semester{}2020"  
s.format("-", " ab 10/")
```

```
t = "A {0} with a {1} is still a {0}."  
t.format("fool", "tool")
```

```
z = "{0:d}, {0:f} oder {0:E}"  
z.format(1234)
```

```
z = "%d, %f oder %3E"  
z %(1234, 12.34, 12)
```

```
print "int: %d, float: %f und string: %s" % (1, 2.3, "cada")
```

Tupel

```
x = 'abra', 13  
a, b = x  
b  
tuple('abra')
```

Lexikon

```
Lex = {}  
Lex['abra'] = 'cadabra'  
Lex  
Lex[17] = 42  
Lex
```
